2. Determine the objective and use the decision variables to write an expression for the *objective function*.
3. Determine the *explicit constraints* and write a functional expression for each of them.
4. Determine the *implicit constraints*.

# Model 10: Detergent Production

The Rosseral Company is a small detergent manufacturing company. It is one of several companies that produce a new, nonpolluting "washday whitener" called NPW. Rosseral can sell NPW to other detergent manufacturers for \$0.80 per gallon. Rosseral itself manufactures detergent that uses NPW. This NPW can be purchased outside for \$1.20 per gallon (shipping and handling charges have been added) or be obtained from Rosseral's own production. Each gallon of detergent produced requires .1 gallon of NPW. Production costs for NPW and detergent are respectively \$0.50 and \$0.60 per gallon. Detergent production costs includes the cost for the .1 gallon of NPW used in each gallon of detergent. Detergent can be sold for \$0.70 per gallon. Production capacities at Rosseral are: NPW – 10,000 gallons per month; detergent – 120,000 gallons per month. Formulate the problem of maximizing profit as a linear program.

# Model 10: Detergent Production

What are the decision variables?

# Model 10: Detergent Production

What are the decision variables?

What decisions are required?

# Model 10: Detergent Production

What are the decision variables?

What decisions are required?

- $DP$ = gallons of detergent to produce per month

# Model 10: Detergent Production

What are the decision variables?

What decisions are required?

- $DP$ = gallons of detergent to produce per month
- $NP$ = gallons of NPW to produce per month

# Model 10: Detergent Production

What are the decision variables?

What decisions are required?

- $DP$ = gallons of detergent to produce per month
- $NP$ = gallons of NPW to produce per month
- $NB$ = gallons of NPW to buy each month

# Model 10: Detergent Production

What are the decision variables?

What decisions are required?

- $DP$ = gallons of detergent to produce per month
- $NP$ = gallons of NPW to produce per month
- $NB$ = gallons of NPW to buy each month
- $NS$ = gallons of NPW to sell each month

# Model 10: Detergent Production

What are the decision variables?

What decisions are required?

- $DP$ = gallons of detergent to produce per month (sold)
- $NP$ = gallons of NPW to produce per month
- $NB$ = gallons of NPW to buy each month
- $NS$ = gallons of NPW to sell each month

# Model 10: Detergent Production

What are the decision variables?

What decisions are required?

- $DP$ = gallons of detergent to produce per month (sold)
- $NP$ = gallons of NPW to produce per month
- $NB$ = gallons of NPW to buy each month
- $NS$ = gallons of NPW to sell each month
- $ND$ = gallons of NPW used in the production of detergent each month.

# Model 10: Detergent Production

What is the objective?

# Model 10: Detergent Production

What is the objective?

Maximize Profit = Revenue − Costs

# Model 10: Detergent Production

What is the objective?

Maximize Profit = Revenue − Costs

- Revenue

# Model 10: Detergent Production

What is the objective?

Maximize Profit = Revenue − Costs

- Revenue $= 0.8NS$

# Model 10: Detergent Production

What is the objective?

Maximize Profit = Revenue − Costs

- Revenue $= 0.8NS + 0.7DP$

# Model 10: Detergent Production

What is the objective?

Maximize Profit = Revenue − Costs

- Revenue $= 0.8NS + 0.7DP$
- Costs

# Model 10: Detergent Production

What is the objective?

Maximize Profit = Revenue − Costs

- Revenue $= 0.8NS + 0.7DP$
- Costs $= 0.5NP$

# Model 10: Detergent Production

What is the objective?

Maximize Profit = Revenue − Costs

- Revenue $= 0.8NS + 0.7DP$
- Costs $= 0.5NP + 0.6DP$

# Model 10: Detergent Production

What is the objective?

Maximize Profit = Revenue − Costs

- Revenue $= 0.8NS + 0.7DP$
- Costs $= 0.5NP + 0.6DP + 1.2NB$

Production Bounds:

- Detergent: $DP \leq 120,000$
- NPW: $NP \leq 10000$

NPW-Detergent Relationship: $DP = 10ND$

NPW Variables Inter-Relationships:

$$ND + NS \leq NP + NB$$

Implicit Constraints: $0 \leq DP, NP, NS, NB, ND$

# Model 10: Detergent Production

The complete model.

$$
\begin{aligned}
\text{maximize} \quad & .8NS + .7DP - .5NP - .6DP - 1.2NB \\
\text{subject to} \quad & NP \leq 10,000 \\
& DP \leq 120,000 \\
& DP = 10ND \\
& ND + NS \leq NP + NB \\
& 0 \leq DP, NP, NS, NB, ND
\end{aligned}
$$

# Model 9: Investing Over Time

An investor has money-making activities A and B available at the beginning of each of the next 5 years. Each dollar invested in A at the beginning of 1 year returns \$1.40 (a profit of \$0.40) 2 years later (in time for immediate re-investment). Each dollar invested in B at the beginning of 1 year returns \$1.70 3 years later.

In addition, investments C and D will each be available at one time in the future. Each dollar investment in C at the beginning of year 2 returns \$1.90 at the end of year 5. Each dollar invested in D at the beginning of year 5 returns \$1.30 at the end of year 5.

Money uninvested in a given year earns 3% per annum.

The investor begins with \$50,000 and wishes to know which investment plan maximizes cash balance at the beginning of year 6. Formulate the linear programming model for this problem.

# Model 9: Investing Over Time

What are the decision variables?

# Model 9: Investing Over Time

What are the decision variables?

- Dollars invested in A yrs 1-4: $A_1,\ A_2,\ A_3,\ A_4$

# Model 9: Investing Over Time

What are the decision variables?

- Dollars invested in A yrs 1-4: $A_1,\ A_2,\ A_3,\ A_4$
- Dollars invested in B yrs 1-3: $B_1,\ B_2,\ B_3$

- Dollars invested in B yrs 1-3: $B_1,\ B_2,\ B_3$
- Dollars invested in C yr 2: $C_2$
- Dollars invested in D yr 5: $D_5$
- Dollars at 3% in yrs 1-5: $S_1,\ S_2,\ S_3,\ S_4,\ S_5$

# Model 9: Investing Over Time

What is the objective function?

# Model 9: Investing Over Time

What is the objective function?

Maximize the cash balance at the beginning of year 6.

# Model 9: Investing Over Time

What is the objective function?

Maximize the cash balance at the beginning of year 6.

How can we represent this cash balance using the decision variables given?

# Model 9: Investing Over Time

What is the objective function?

Maximize the cash balance at the beginning of year 6.

How can we represent this cash balance using the decision variables given?

This is not easy to do at this point in our modeling.

# Model 9: Investing Over Time

What is the objective function?

Maximize the cash balance at the beginning of year 6.

How can we represent this cash balance using the decision variables given?

This is not easy to do at this point in our modeling.

So we make it easy by adding in a new decision variable.

# Model 9: Investing Over Time

What is the objective function?

Maximize the cash balance at the beginning of year 6.

How can we represent this cash balance using the decision variables given?

This is not easy to do at this point in our modeling.

So we make it easy by adding in a new decision variable.

$$T = \text{Cash balance at the beginning of year 6}$$
