

FUNDAMENTALS OF OPTIMIZATION

LECTURE NOTES

1997

R. T. Rockafellar

Depts. of Mathematics and Applied Mathematics

University of Washington

Seattle

Table of Contents

1. WHAT IS OPTIMIZATION?	Page 1
Optimization problem	1
Goals of the subject	1
Distinguishing features of optimization	1
Finite-dimensional optimization	2
Constraints	2
Mathematical programming	2
EXAMPLE 1: Engineering Design	3
EXAMPLE 2: Management of Systems	5
EXAMPLE 3: Identification of Parameters	7
EXAMPLE 4: Variational Principles	10
EXAMPLE 5: Optimal Control	12
EXAMPLE 6: Optimal Scheduling	14
Overview of areas of optimization	15
2. PROBLEM FORMULATION	16
Basic problem	16
Solution concepts	16
Constraint manipulation	17
Boxes	17
Linear and affine functions	17
Conventional problem format	18
Geometric considerations	18
Geometry of linear constraints	19
Geometric interpretation of linear programming	19
General constraints in vector notation	20
Penalties and the choice of objectives	20
Composite format in optimization	21
Max functions and nonsmoothness	22
Abstract format for optimization	23
Overview of the different formats	23
Aspects of good problem formulation	23
The role of sequences	24
Example: potential trouble in linear programming	24
Existence of feasible solutions	25
Uniqueness of optimal solutions	25
Existence of optimal solutions	25
Approximate feasibility	25
Well posed problems	26
Review of terminology and notation	26
Standard criterion for the attainment	28
Example: problems with only an abstract constraint	29
Example: the gap distance between two sets	29
Convergence to a solution	30
Comparison of possible solution methods	32
Rates of convergence	32
3. UNCONSTRAINED MINIMIZATION	33
Review of differentiability	33
Continuous differentiability classes	33
Expansions	34

Local information	35
Optimality considerations	36
Local versus global optimality	37
Convex functions	37
Tests for convexity using derivatives	38
Consequences of convexity in unconstrained minimization	40
Convexity of quadratic functions	40
Applications to numerical optimization	41
Descent methods	41
Example: Cauchy's method	42
Example: Newton's method in optimization	42
Effectiveness and validation of descent methods	43
Convergence questions	44
Extensions	47
Example: Quasi-Newton methods	47
Example: Trust region methods	47
Optimization versus equation solving	48
4. CONSTRAINED MINIMIZATION	49
Feasible directions	49
Variational geometry	50
Tangent vectors	50
Tangent cone at a point	50
Tangents in some extreme cases	51
Tangents to boxes	51
Tangents to polyhedral sets	52
Characterizations of optimality	53
Optimality over a box	55
Convexity in optimization	55
Convex sets	55
Basic examples of convex sets	56
Tangents to convex sets	56
Convex functions on convex sets	58
Convexity-preserving operations	58
Level sets of convex functions	59
Convex constraints	59
Convex programming	59
Convexity in estimating progress	61
Duality	61
Minimization of nonsmooth convex functions	62
Piecewise linear approximations	62
Minimizing a max of convex functions	63
Norms	64
5. LAGRANGE MULTIPLIERS	65
Normal vectors	65
Normal cone at a point	65
Normals to convex sets	66
Versatility of the normal cone condition	67
Fermat's rule as a special case	67
Normals to boxes	68
Tangents from normals under regularity	68
Normal vectors for constraint representations	69

Tangents to sets with constraint structure	73
Lagrange multipliers	73
Example of normal and tangent spaces	74
Normals to sets with linear structure	75
Normals to polyhedral sets	77
Lagrange multipliers in optimality	78
Lagrange multipliers for problems in conventional format	78
Basic constraint qualification	79
Kuhn-Tucker conditions	80
Lagrangian function	80
Lagrangian form of the Kuhn-Tucker conditions	80
Convex programming with linear constraints	81
Second-order conditions	83
Specialization to linear constraints	86
Curvature of a nonlinear feasible set	86
6. GAMES AND DUALITY	87
Kuhn-Tucker conditions in linear programming	87
Dual linear programming problem	88
Existence of optimal solutions in linear programming	89
Dantzig's simplex method in linear programming	90
Duality more generally	91
Two-person, zero-sum games	92
Generality of the game concept	92
Saddle points	93
Broader game models	94
Optimization problems derived from a game	95
Application of game theory to Lagrangians	97
Lagrangian dual problem	98
Convexity properties of the dual problem	98
Basic primal-dual relationships	99
Game-theoretic interpretation of duality	100
Lagrangian relaxation	102
Decomposition of large-scale problems	103
Example: Decentralization of decision making	103
Some other approaches to problem decomposition	106
