# Parametric equations

A pair of equations

$$x = f(t)$$

$$y = g(t) \quad a \leq t \leq b \quad (\text{sometimes we write this as } t \in [a, b])$$

Describes a 2D curve consisting of all points of the form  
 $P = (f(t), g(t))$  for  $t \in [a, b]$

## Example

$$x = t - \sin t$$

$$y = 1 - \cos t \quad 0 \leq t \leq 20$$

Describes the curve below :

The same pair of equations

$$x = f(t)$$

$$y = g(t) \quad a \leq t \leq b$$

Also describes an object moving in 2D, that is gives information about the trajectory, starting position and velocity of the object.

## Linear motion

Alice runs along a straight line  $L$ . She is at  $P(1, 2)$  at time  $t = 0$  and at  $Q(-3, 5)$  at  $t = 5$ . Find Alice's equation of motion.

## Parametric equations of a circle

$$x = x_0 + r \cos t$$

$$y = y_0 + r \sin t \quad 0 \leq t \leq 2\pi$$

Parametric equation of a circle centered at  $C = (x_0, y_0)$  and of radius  $r$

## More general parametric equations of a circle

$$x = x_0 + r \cos(\omega t + \alpha)$$

$$y = y_0 + r \sin(\omega t + \alpha) \quad 0 \leq t \leq T$$

Describe the motion of an object going around a circle centered at  $C = (x_0, y_0)$  and of radius  $r$ , with angular velocity  $\omega$  starting at position  $P = (x_0 + r \cos(\alpha), y_0 + r \sin(\alpha))$

## Uniform circular motion : motion of an object moving around a circle with constant velocity

- ▶ Angular velocity  $\omega$ : speed at which angle  $\theta$  swept by radius changes.  $\theta = \omega t$
- ▶ Linear velocity  $v$  : velocity of the moving object.  $v = \omega r$
- ▶ Period  $T$ : time it takes the object to complete a full revolution .  $T = \frac{2\pi}{\omega}$

## Example

Write the parametric equations of an object moving around the circle of radius 5, centered at the origin, with angular velocity  $\omega = 2$  radians per second , starting at the point  $P = (0, 5)$

Suppose that the motion of an object is described by the equations

$$x = 2 + \cos(2t + \pi)$$

$$y = -1 + \sin(2t + \pi) \quad 0 \leq t \leq \pi$$

Describe how the object moves.

Describe the curve

$$x = 2 \cos(2t + \pi)$$

$$y = 3 \sin(2t + \pi) \quad 0 \leq t \leq \pi$$
