Reading: Sections 1, 2, 3 and 4, Chapter 9 from Royden. Sections 2, 4, 5 and 6 Chapter 4 from Folland.

Problems from Folland:

Chapter 4, Section 1: problems 3, 4, 6 and 10.

Chapter 4, Section 2: problems 14, 16.

(*) Problem Consider the space $C((0,1))$ of continuous real-valued functions on the interval $(0,1)$, and for $x \in (0,1)$ define the evaluation map $P_x : C((0,1)) \to \mathbb{R}$ by $P_x f = f(x)$. We give $C((0,1))$ the weakest topology $\mathcal{T}$ for which $P_x$ is a continuous map for each point $x \in (0,1)$. Show that the topology $\mathcal{T}$ is not metrizable; that is, there is no metric on $C((0,1))$ that induces the topology $\mathcal{T}$.
